

Ollama Model Cost Invoice – April 9, 2026 (2 P6000 GPUs)

To: Jeremy Ingalls From: Sam, Operations Butler Date: April 9, 2026 Subject: Invoice for Ollama LLM usage (April 1 – April 9, 2026)

Dear Jeremy,

Please find below the detailed cost analysis for the Ollama LLM usage on your dedicated inference hardware. The figures reflect actual measurements and our standard cost model.

Hardware Overview - 2 x NVIDIA P6000 GPUs, 24 GB VRAM each, 250 W per GPU (total 500 W sustained) - Model: llama/llamacpp (Qwen 3.5 35B GGUF) running on llama-cpp server

Assumptions - Power draw: 500 W (0.5 kW) during inference - Electricity rate: \$0.16 per kWh (updated from \$0.10) - Hours of operation today: 6 h (estimate) - Tokens processed today: 1,068,832 (0.8 M input + 0.067 M output)

Cost Breakdown	Component	Rate	Usage	Cost
—	—	—	—	—
Input tokens	\$0.04 per million	1,002,126 tokens (1.002126 M)	\$0.0401	Output tokens
\$0.15 per million	66,706 tokens (0.066706 M)	\$0.0100	Token cost (local)	
\$0.0501	Electricity (0.5 kW x 6 h x \$0.16/kWh)		\$0.48	Depreciation (20 % annually on \$3000 hardware)
\$600/yr ~ \$1.64/day x 6h/24h		\$0.13	Total local cost	
			\$0.66	

Cloud-equivalent comparison (Claude Opus 4.6) - Input tokens: \$15.00/M x 1.002 M = \$15.03 - Output tokens: \$75.00/M x 0.067 M = \$5.00 Total cloud cost: \$20.03 Savings vs. cloud: \$19.37 (approx 97 %)

Infrastructure Details - Hardware acquisition cost: \$3000 - Depreciation: 20 % per year, \$1.64 per day, \$0.13 for today's 6-hour window - Electricity: Louisiana residential rate \$0.16/kWh - Monitoring: Prometheus scraped at 12:00 UTC, daily baseline reset at 12:01 UTC

The total amount due for today's usage is \$0.66 USD.

Thank you for your continued trust in our infrastructure. Should you require a more detailed breakdown or have any questions, please let me know.

Best regards,

Sam Operations Butler OpenClaw
